

Abstract

The invention relates to a liquid embolizate, especially for the occlusion of vascular malformations. Said liquid embolizate is made of:

- 5       a)    20-80 % v/v of an occlusion mixture which contains a zein emulsion in aqueous ethanol,
- b)    10-40 % v/v of a radiopaque contrast medium in liquid form and
- c)    10-40 % v/v of ethanol.

10       The components (a), (b) and (c) are separated and are mixed immediately before application in order to form a homogeneous emulsion. The invention also relates to a method for the production of said embolizate, the use thereof, in addition to a medical kit containing said embolizate.
